

All computers connecting to the Marist network are required to run McAfee VirusScan Enterprise, which is provided by the College to all students, faculty and staff. All Marist-owned and ThinkPad University Program computers have this software preinstalled. By default, this software is set to automatically update itself twice a day and scans each file before it is written to disk.

How To Install McAfee on Windows

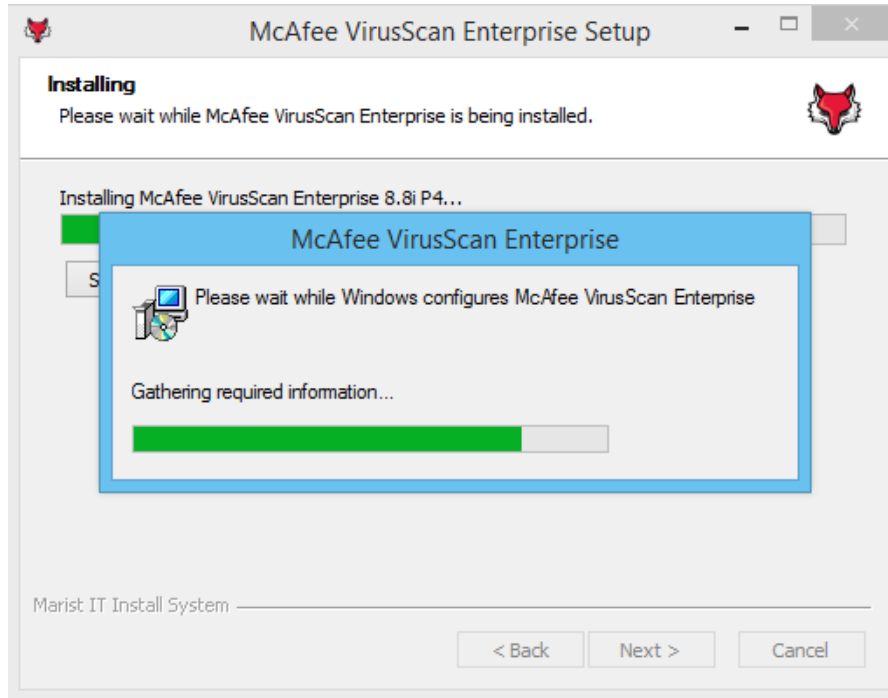

1. Remove any anti-virus software before proceeding. Running multiple anti-virus programs can cause conflicts and significant performance degradation.
2. Download and run the McAfee installer from <http://www.marist.edu/it/resnet/antivirus.html>. Click **Install** to proceed.

Click to proceed with installation

How To Manually Update McAfee DAT Files (cont'd)

- 3. The installation will begin as well as download the latest virus definition files. The installation could take several minutes depending on the speed of the computer.

- 4. When the installation completes, click **Finish** to reboot the computer.
